Sung Ha Hwang

Software Engineer, ex-Meta (Feed and Threads ranking) | Full-stack apps live on Google Play and the App Store
hwansung595@gmail.com | github.com/hwangso595 | sungha.me

WORK EXPERIENCE

Meta Jul 2024 – Jul 2026
Software Engineer, Feed and Threads ranking (Facebook, Instagram, Threads)

- Cut $2.86M a year in GPU cost (77 A100 hosts) by moving a production ranking model's backfill jobs to off-peak hours.
- Launched a Llama-based content-quality model in Facebook Feed ranking, raising daily active users by 0.0183% worldwide (roughly 380K more people a day) and 0.0444% in the US and Canada in a two-week A/B test.
- Built a clustering step that groups similar posts for Threads recommendations, increasing time spent on Threads by 0.32%.
- Built an internal dashboard showing the live values of 200+ ML model inputs, so engineers can see why a post ranked without reproducing it; 15K views a month.
- Built the initial fast like-bait and comment-bait classifier, a small model trained to copy Gemini 3.5 Flash (80% precision, 60% recall on human labels), launched to demote bait posts.

Northern Labs Sep 2022 – Dec 2022
Software Engineer Intern

- Built backend services for a cryptocurrency payment system (Elixir, TypeScript, Kubernetes) with end-to-end tests and Slack alerts that caught failures before customers did.

CGI Group Inc. Sep 2020 – Apr 2021
Java Developer Co-op

- Halved page load time for 10K+ daily users by fetching data in parallel with Java threads.

PROJECTS

GroceryPulse | grocerypulse.ca 2026

- Built a Canadian grocery price index and data API that collects about 8K prices a week from 22 grocery chains (∼160 stores, 13 cities) into an append-only history.
- Rebuilt price collection: each request dropped from 80 s to 0.7 s, a weekly run from 6 hours to under 2, and store coverage rose from 81% to 94%.
- Matched a retail client's 44.6K products to 31K competitor products (matching rules plus AI review), lifting the share of their catalog with a competitor price from 33% to 43.5%; 29 of 30 spot-checked matches were correct.

Culdesac | yourculdesac.com 2025 – 2026

- Built and launched an Android app, as the only engineer, for finding local events and meeting neighbours: personalized feed, map, group chat, and daily imports from public event calendars (React Native, Supabase/Postgres).
- Ranked the feed by interests, distance and freshness in SQL, and fixed a bug where posts were silently skipped when their scores changed mid-scroll.
- Automated testing and releases: every change runs about 870 automated tests, and updates that don't touch native code reach phones without a store release.

Blind Pear | App Store, Google Play 2025 – 2026

- Co-built a dating app where people match on personality before seeing photos; fixed a race where two people liking each other at the same moment never matched, and built a live match queue where one person can never be claimed by two matches at once.

Memome 2026

- Built a private AI memory assistant for Android and iOS that runs entirely on the phone and answers questions about your notes and photos with cited sources; 80+ monthly active testers in closed testing.
- Kept a small on-device model to the facts by having the app do date math and lookups and the model write only from retrieved evidence; fixed a C++ bug in llama.rn that cut peak memory from 646 to 479 MB.

E-Ink Sync | GitHub 2026

- Open-source Obsidian plugin (350+ downloads) that syncs reMarkable tablets to your notes without the vendor cloud, including a hand-written parser for the tablet's undocumented pen-stroke file format.

EDUCATION

University of Toronto 2019 – 2023
B.Sc. Computer Science, GPA 3.98/4.0

- Teaching Assistant, CSCB58 Computer Organization; Research Intern, embARC Research Group (sparse matrix formats)

SKILLS

Languages: Python, TypeScript/JavaScript, Java, SQL, Hack, C, Elixir, HTML/CSS
Tools: React, React Native/Expo, Next.js, Node.js, PyTorch, PostgreSQL/Supabase, Docker, Kubernetes, GitHub Actions
